

Chapter 7: Transport Layer

Introduction to Networking

Cisco | Networking Academy®
Mind Wide Open™

Chapter 7

7.1 Transport Layer Protocols

7.2 TCP and UDP

7.3 Summary

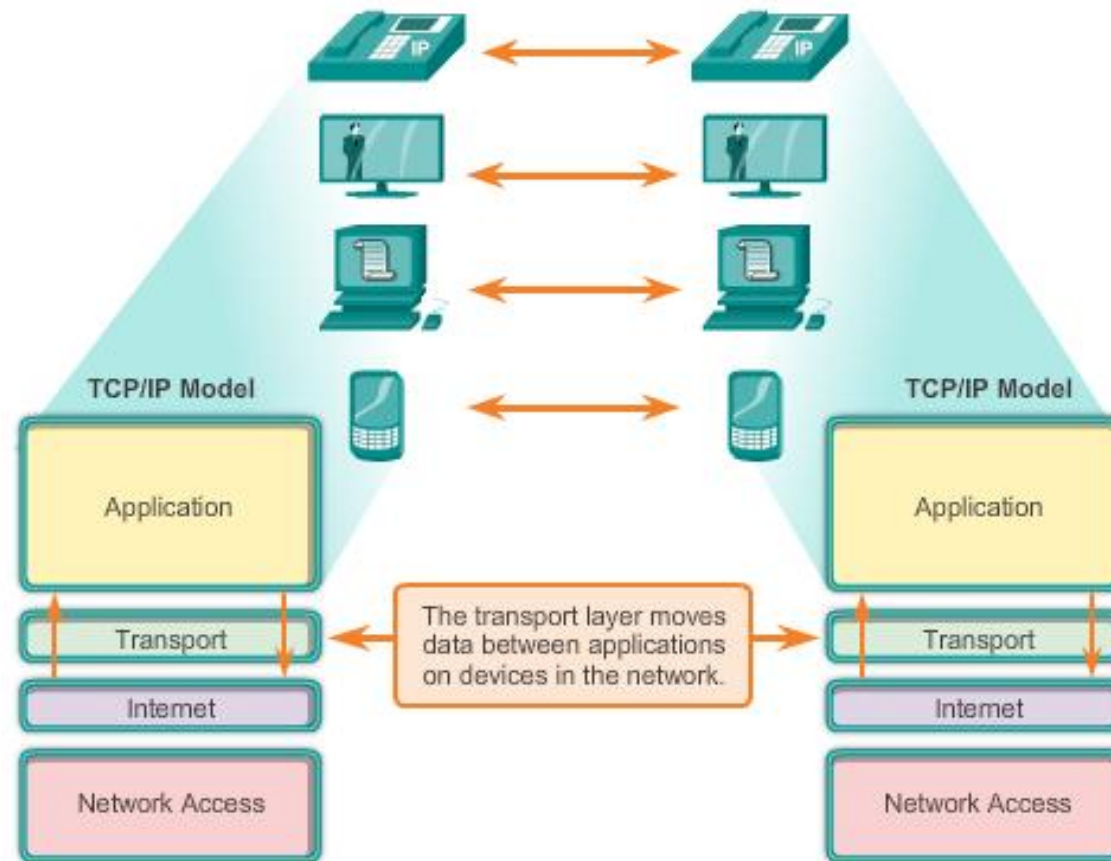

Chapter 7: Objectives

- Describe the purpose of the transport layer in managing the transportation of data in end-to-end communication.
- Describe characteristics of the TCP and UDP protocols, including port numbers and their uses.
- Explain how TCP session establishment and termination processes facilitate reliable communication.
- Explain how TCP protocol data units are transmitted and acknowledged to guarantee delivery.
- Explain the UDP client processes to establish communication with a server.
- Determine whether high-reliability TCP transmissions, or non-guaranteed UDP transmissions, are best suited for common applications.

Role of the Transport Layer

Enabling Applications on Devices to Communicate

Transportation of Data

Role of the Transport Layer

The **Transport Layer** is responsible for establishing a temporary communication session between two applications and delivering data between them. TCP/IP uses two protocols to achieve this:

- Transmission Control Protocol (TCP)
- User Datagram Protocol (UDP)

Primary Responsibilities of Transport layer Protocols

- Tracking the individual communication between applications on the source and destination hosts
- Segmenting data for manageability and reassembling segmented data into streams of application data at the destination
- Identifying the proper application for each communication stream

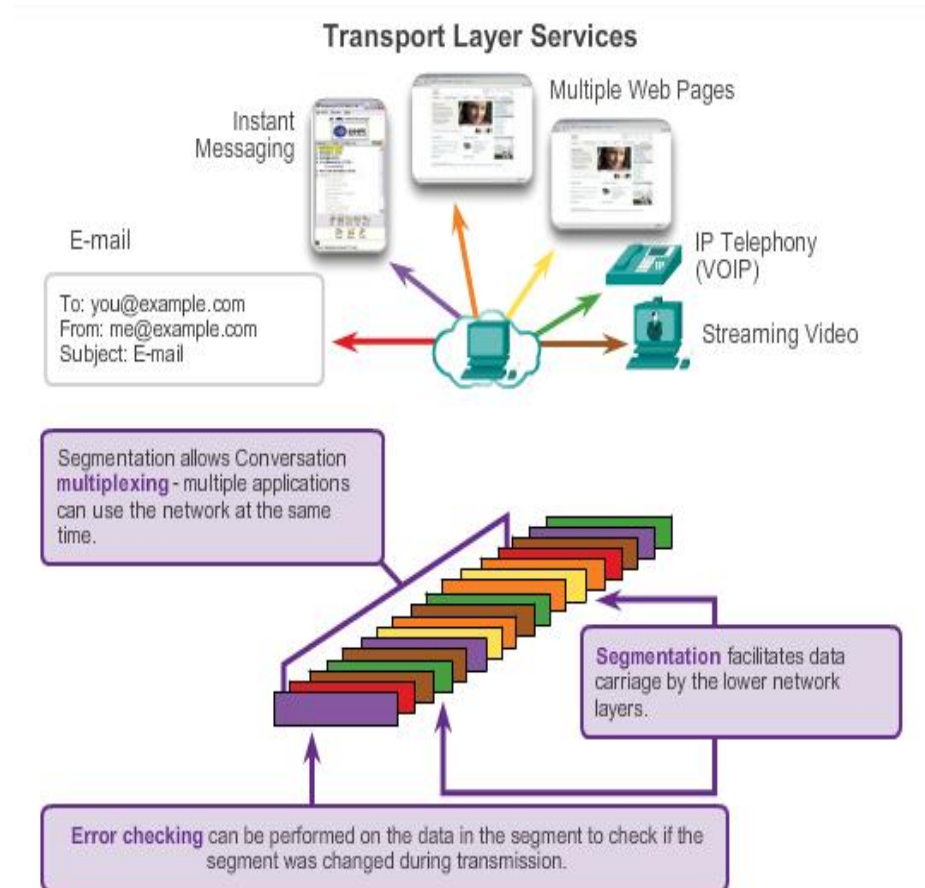

Transportation of Data

Conversation Multiplexing

Segmenting the data

- Enables many different communications, from many different users, to be interleaved (multiplexed) on the same network, at the same time.
- Provides the means to both send and receive data when running multiple applications.
- Header added to each segment to identify it.

Transportation of Data

Transport Layer Reliability

Different applications have different transport reliability requirements

TCP/IP provides two transport layer protocols, **TCP and UDP**

Transmission Control Protocol (TCP)

- Provides reliable delivery ensuring that all of the data arrives at the destination.
- Uses acknowledged delivery and other processes to ensure delivery
- Makes larger demands on the network – more overhead

User Datagram Protocol (UDP)

- Provides just the basic functions for delivery – no reliability
- Less overhead

TCP or UDP

- There is a trade-off between the value of reliability and the burden it places on the network.
- Application developers choose the transport protocol based on the requirements of their applications.

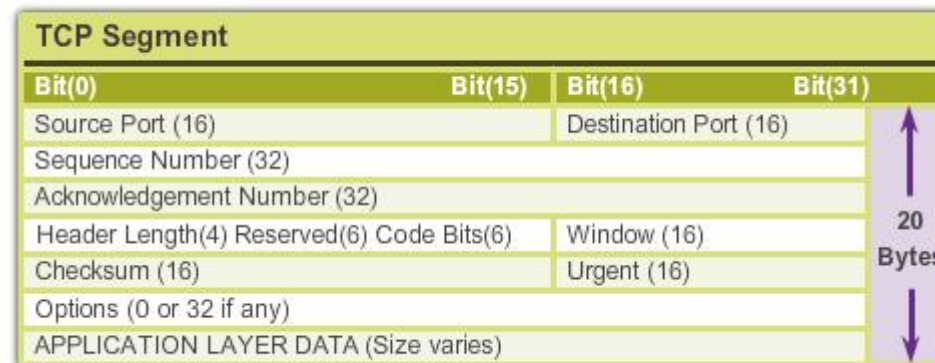

Introducing TCP and UDP

Introducing TCP

Transmission Control Protocol (TCP)

- RFC 793
- Connection-oriented – creating a session between source and destination
- Reliable delivery – retransmitting lost or corrupt data
- Ordered data reconstruction – numbering and sequencing of segments
- Flow control - regulating the amount of data transmitted
- Stateful protocol – keeping track of the session

Introducing TCP and UDP

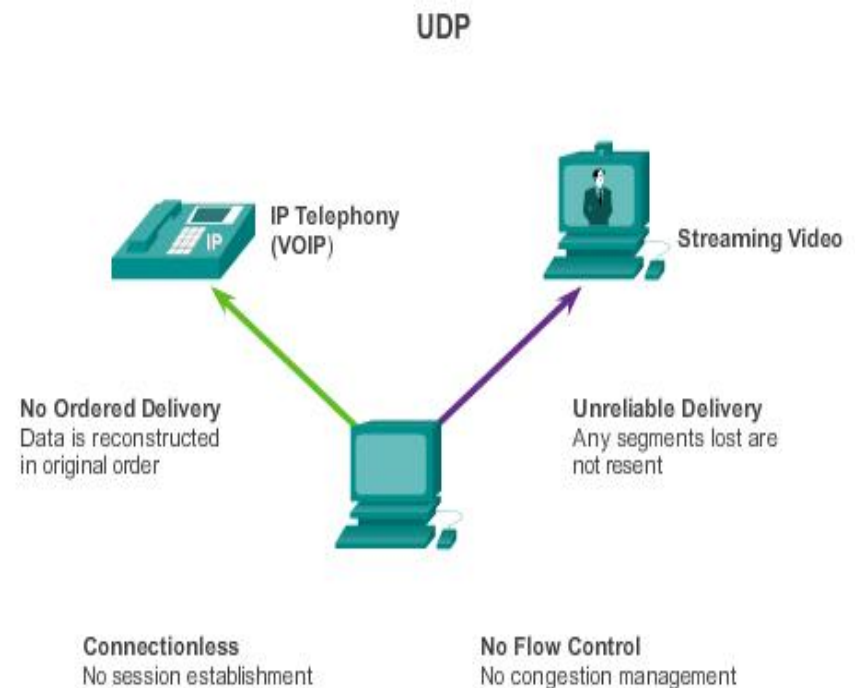

Introducing UDP

User Datagram Protocol (UDP)

- RFC 768
- Connectionless
- Unreliable delivery
- No ordered data reconstruction
- No flow control
- Stateless protocol

Applications that use UDP:

- Domain Name System (DNS)
- Video Streaming
- Voice over IP (VoIP)

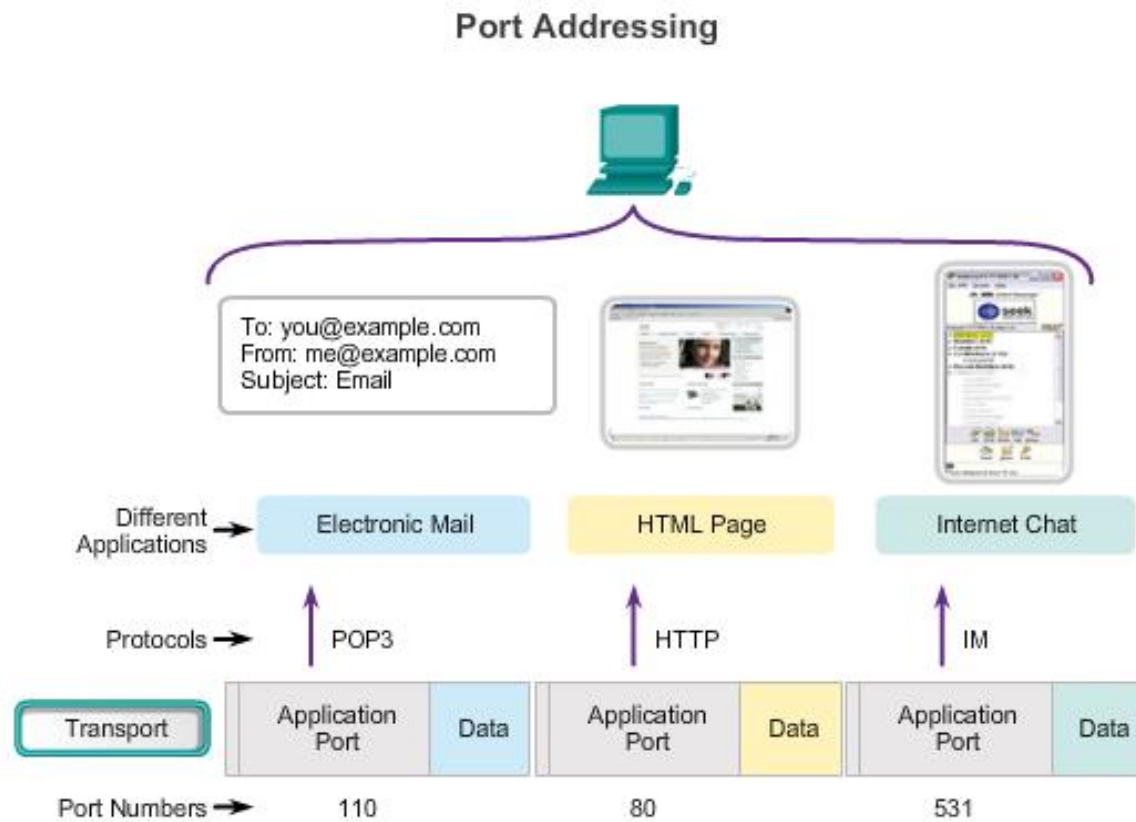

Introducing TCP and UDP

Separating Multiple Communications

Port Numbers are used by TCP and UDP to differentiate between applications.

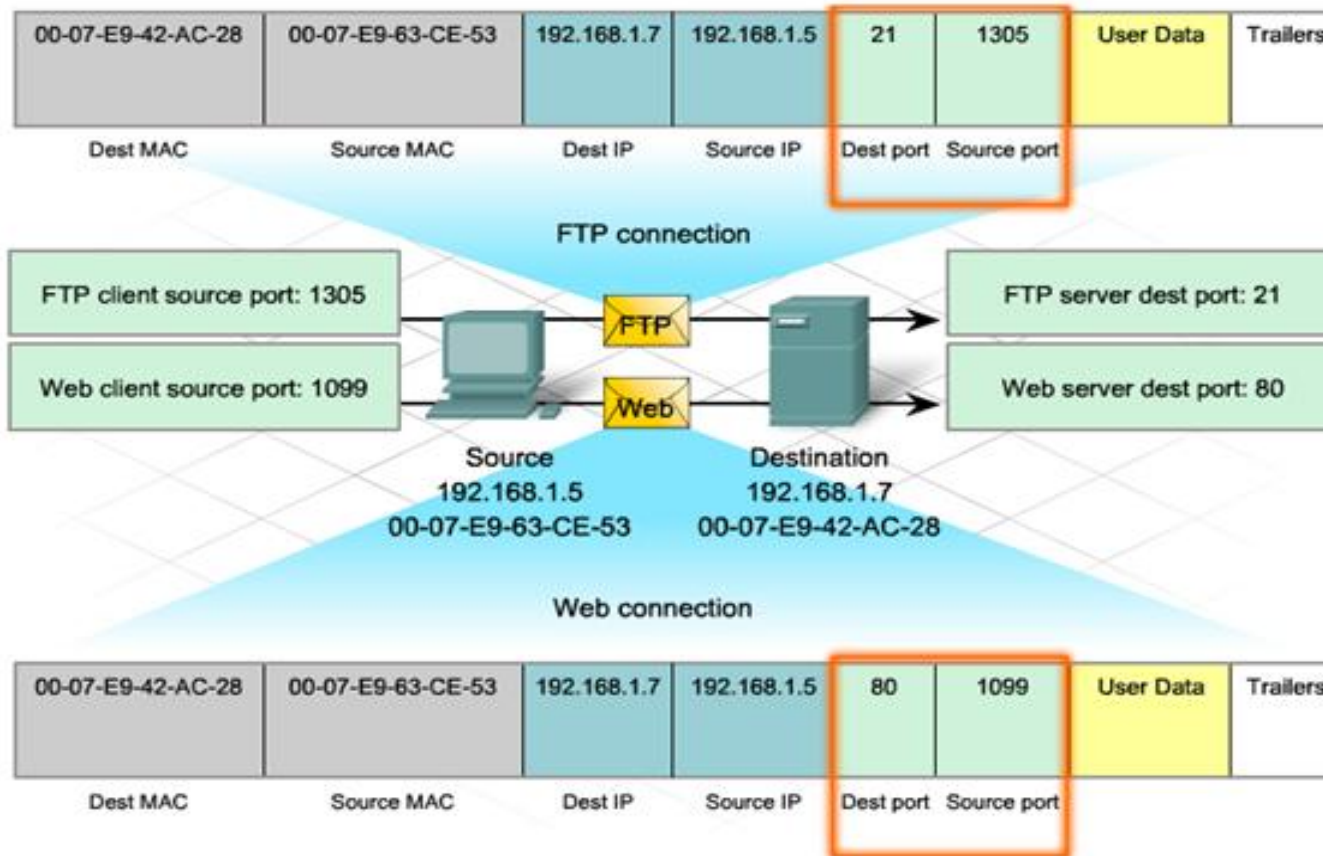

Data for different applications is directed to the correct application because each application has a unique port number.

Introducing TCP and UDP

TCP and UDP Port Addressing

Introducing TCP and UDP

TCP and UDP Port Addressing

Port Numbers

Port Number Range	Port Group
0 to 1023	Well Known (Contact) Ports
1024 to 49151	Registered Ports
49152 to 65533	Private and/or Dynamic Ports

Registered TCP Ports:

1863 MSN Messenger
 2000 Cisco SCCP (VoIP)
 8008 Alternate HTTP
 8080 Alternate HTTP

Well Known TCP Ports:

21 FTP
 23 Telnet
 25 SMTP
 80 HTTP
 110 POP3
 194 Internet Relay Chat (IRC)
 443 Secure HTTP (HTTPS)

Registered UDP Ports:

1812 RADIUS Authentication Protocol
 5004 RTP (Voice and Video Transport Protocol)
 5040 SIP (VoIP)

Well Known UDP Ports:

69 TFTP
 520 RIP

Registered TCP/UDP Common Ports:

1433 MS SQL
 2948 WAP (MMS)

Well Known TCP/UDP Common Ports:

53 DNS
 161 SNMP
 531 AOL Instant Messenger, IRC

Introducing TCP and UDP

TCP and UDP Port Addressing

Netstat

- Used to examine TCP connections that are open and running on a networked host

```

C:\>netstat

Active Connections

Proto  Local Address           Foreign Address         State
TCP    kenpc:3126             192.168.0.2:netbios-ssn ESTABLISHED
TCP    kenpc:3158             207.138.126.152:http   ESTABLISHED
TCP    kenpc:3159             207.138.126.169:http   ESTABLISHED
TCP    kenpc:3160             207.138.126.169:http   ESTABLISHED
TCP    kenpc:3161             sc.msn.com:http        ESTABLISHED
TCP    kenpc:3166             www.cisco.com:http      ESTABLISHED

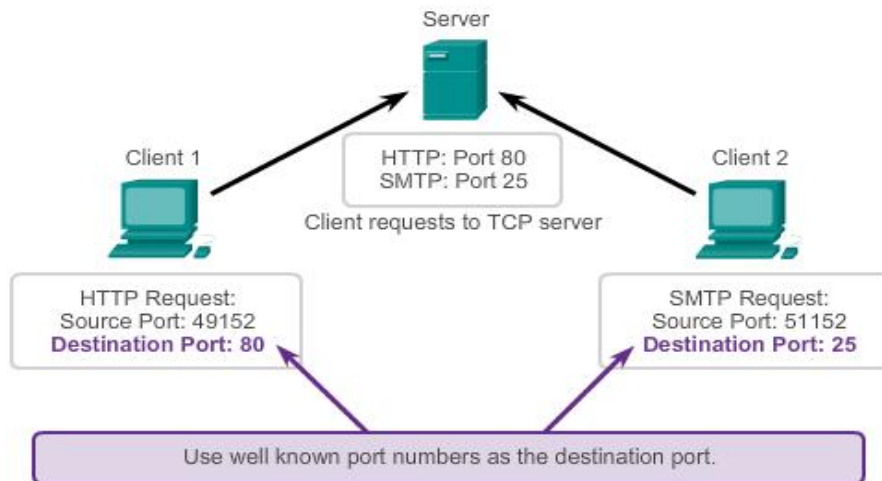

C:\>
  
```

TCP Communication

TCP Server Processes

Request Destination Ports

Request Source Ports

TCP Communication

TCP Connection, Establishment and Termination

Three-Way Handshake

- Establishes that the destination device is present on the network.
- Verifies that the destination device has an active service and is accepting requests on the destination port number that the initiating client intends to use for the session.
- Informs the destination device that the source client intends to establish a communication session on that port number.

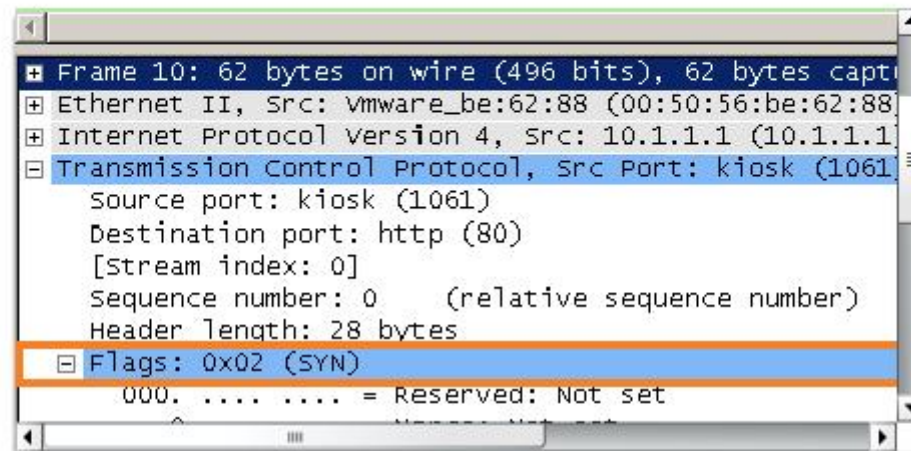

TCP Communication **NEED New Graphic for this and next two slides**

TCP Three-Way Handshake – Step 1

- **Step 1: The initiating client requests a client-to-server communication session with the server.**

TCP 3-way Handshake (SYN)

Protocol Analyzer shows initial client request for session in frame 14

- TCP segment in this frame shows:
- SYN flag set to validate an Initial Sequence Number
 - Randomized sequence number valid (relative value is 0)
 - Random source port 1061
 - Well-known destination port is 80 (HTTP port) indicates web server (httpd)

TCP Communication

TCP Three-Way Handshake – Step 2

- **Step 2: The server acknowledges the client-to-server communication session and requests a server-to-client communication session.**

TCP 3-way Handshake (SYN, ACK)

```

+ Ethernet II, Src: CISCO_b3:74:a0 (00:0c:29:b3:74:a0)
+ Internet Protocol Version 4, Src: 192.168.254.254 (192.168.254.254)
- Transmission Control Protocol, Src Port: http (80),
  Source port: http (80)
  Destination port: kiosk (1061)
  [Stream index: 0]
  Sequence number: 0 (relative sequence number)
  Acknowledgement number: 1 (relative ack number)
  Header length: 28 bytes
- Flags: 0x12 (SYN, ACK)
  000. .... = Reserved: Not set
  ...0 .... = Nonce: Not set
  
```

A protocol analyzer shows server response in frame 15

- ACK flag set to indicate a valid Acknowledgement number
- Acknowledgement number response to initial sequence number as relative value of 1
- SYN flag set to indicate the Initial Sequence Number for the server to client session
- Destination port number of 1061 to corresponding to the clients source port
- Source port number of 80 (HTTP) indicating the web server service (httpd)

TCP Communication

TCP Three-Way Handshake – Step 3

- **Step 3: The initiating client acknowledges the server-to-client communication session.**

```

TCP 3-way Handshake (ACK)
Source port: kiosk (1061)
Destination port: http (80)
[Stream index: 0]
Sequence number: 1 (relative sequence number)
Acknowledgement number: 1 (relative ack number)
Header length: 20 bytes
Flags: 0x10 (ACK)
  000. .... = Reserved: Not set
  ...0 .... = Nonce: Not set
  .... 0... = Congestion window Reduced (CWR)
  .... .0.. = ECN-Echo: Not set
  .... ..0. = Urgent: Not set
  
```

Protocol Analyzer shows client response to session in frame 16

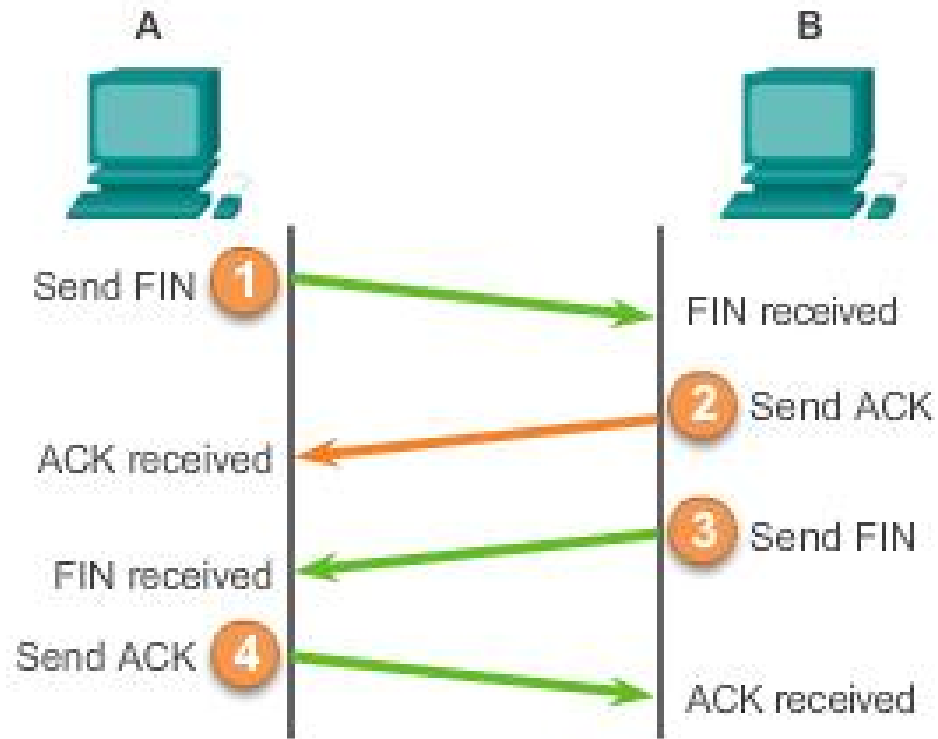

The TCP segment in this frame shows:

- ACK flag set to indicate a valid Acknowledgement number
- Acknowledgement number response to initial sequence number as relative value of 1
- Source port number of 1061 to corresponding
- Destination port number of 80 (HTTP) indicating the web server service (httpd)

TCP Communication

TCP Session Termination

A sends ACK response to B.

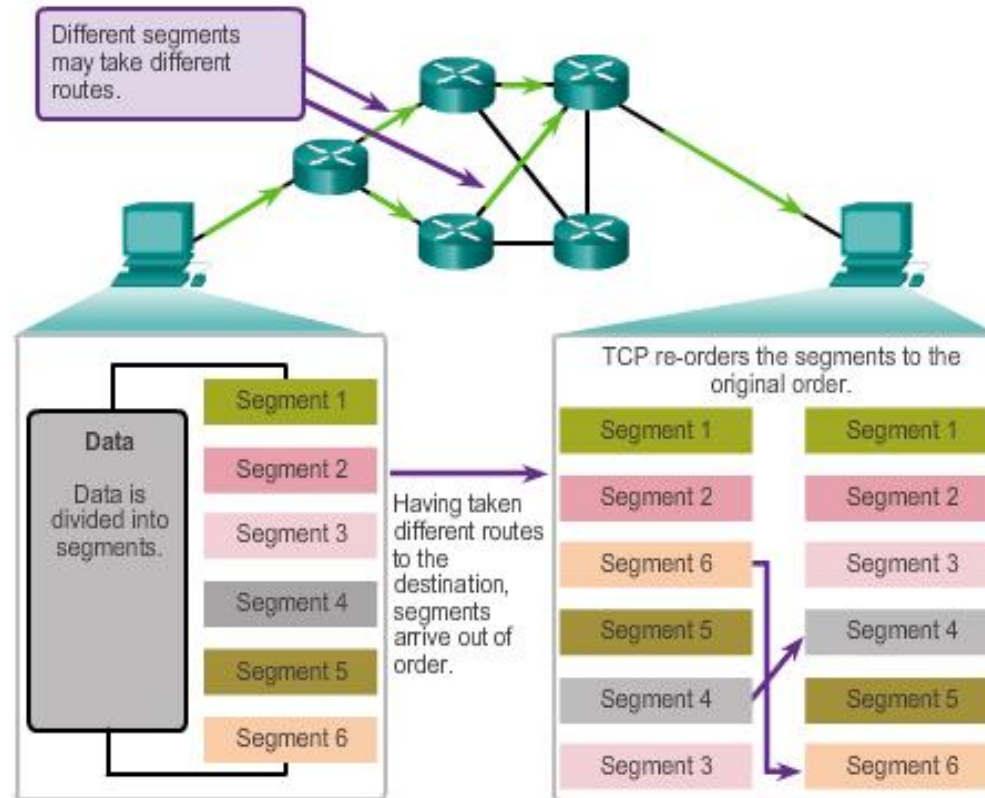

Reliability and Flow Control

TCP Reliability – Ordered Delivery

Sequence numbers used to reassemble segments into original order

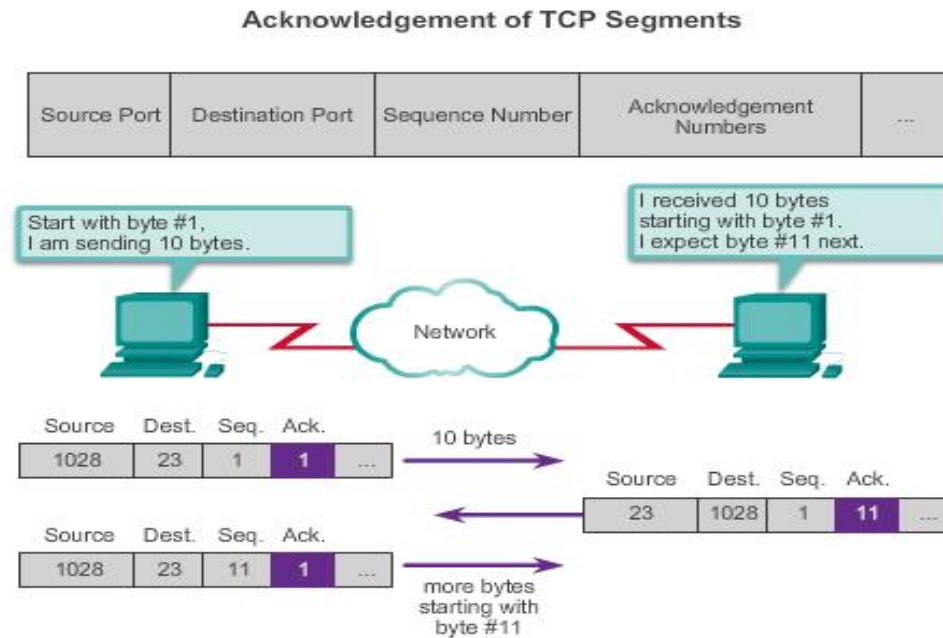

TCP Segments Are Re-Ordered at the Destination

TCP Reliability – Acknowledgement and Window Size

The sequence number and acknowledgement number are used together to confirm receipt.

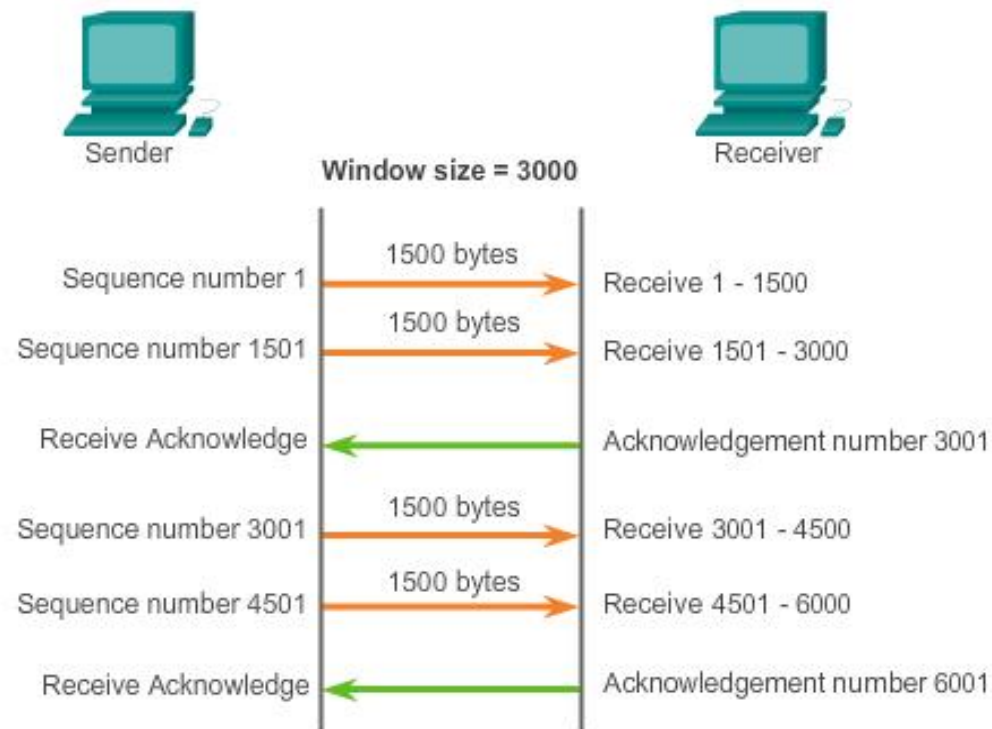

Window Size - The amount of data that a source can transmit before an acknowledgement must be received.

TCP Reliability and Flow Control

Window Size and Acknowledgements

TCP Segment Acknowledgement and Window Size

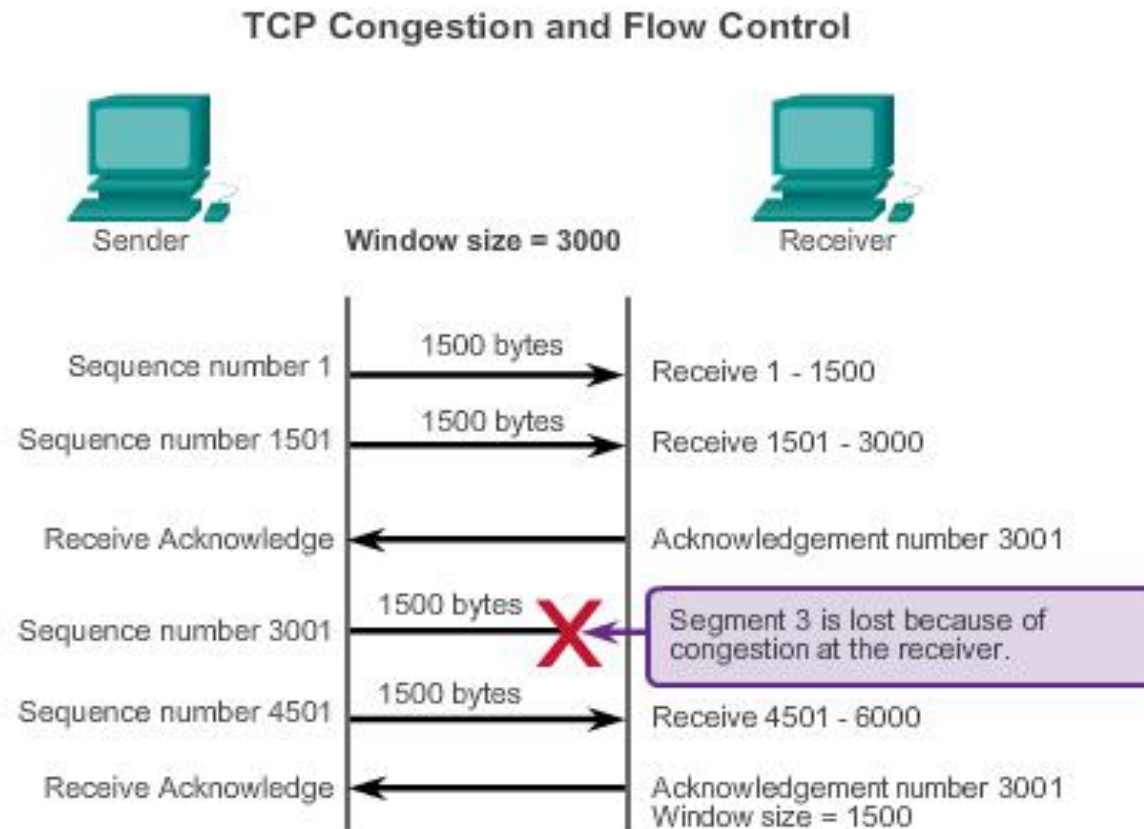

The **window size** determines the number of bytes sent before an acknowledgement is expected.

The **acknowledgement** number is the number of the next expected byte.

Reliability and Flow Control

TCP Flow Control – Congestion Avoidance

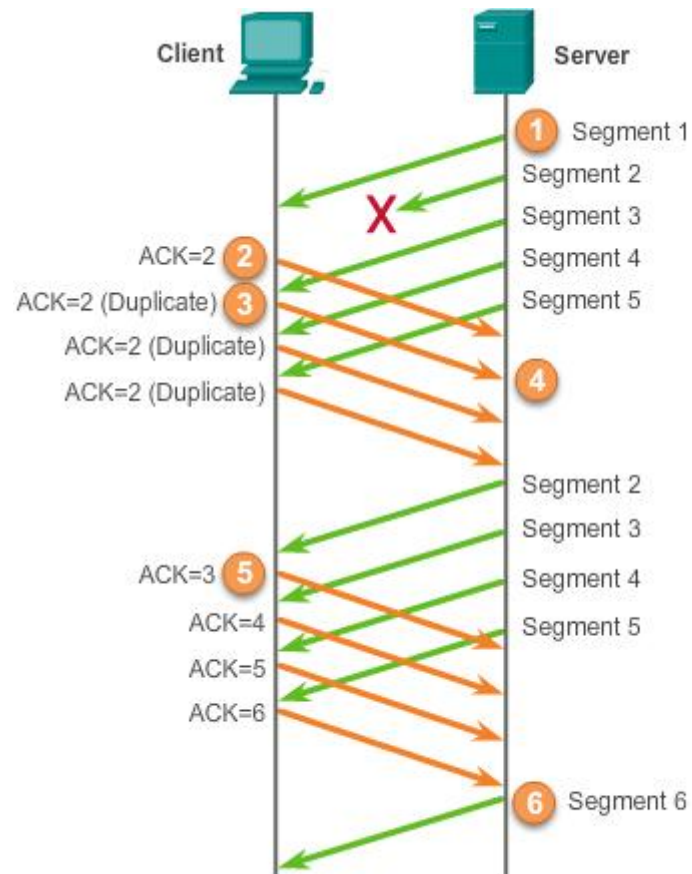

If segments are lost because of congestion, the Receiver will acknowledge the last received sequential segment and reply with a reduced window size.

Reliability and Flow Control

TCP Reliability - Acknowledgements

UDP Communication

UDP Low Overhead vs. Reliability

UDP

- Simple protocol that provides the basic transport layer functions
- Used by applications that can tolerate small loss of data
- Used by applications that cannot tolerate delay

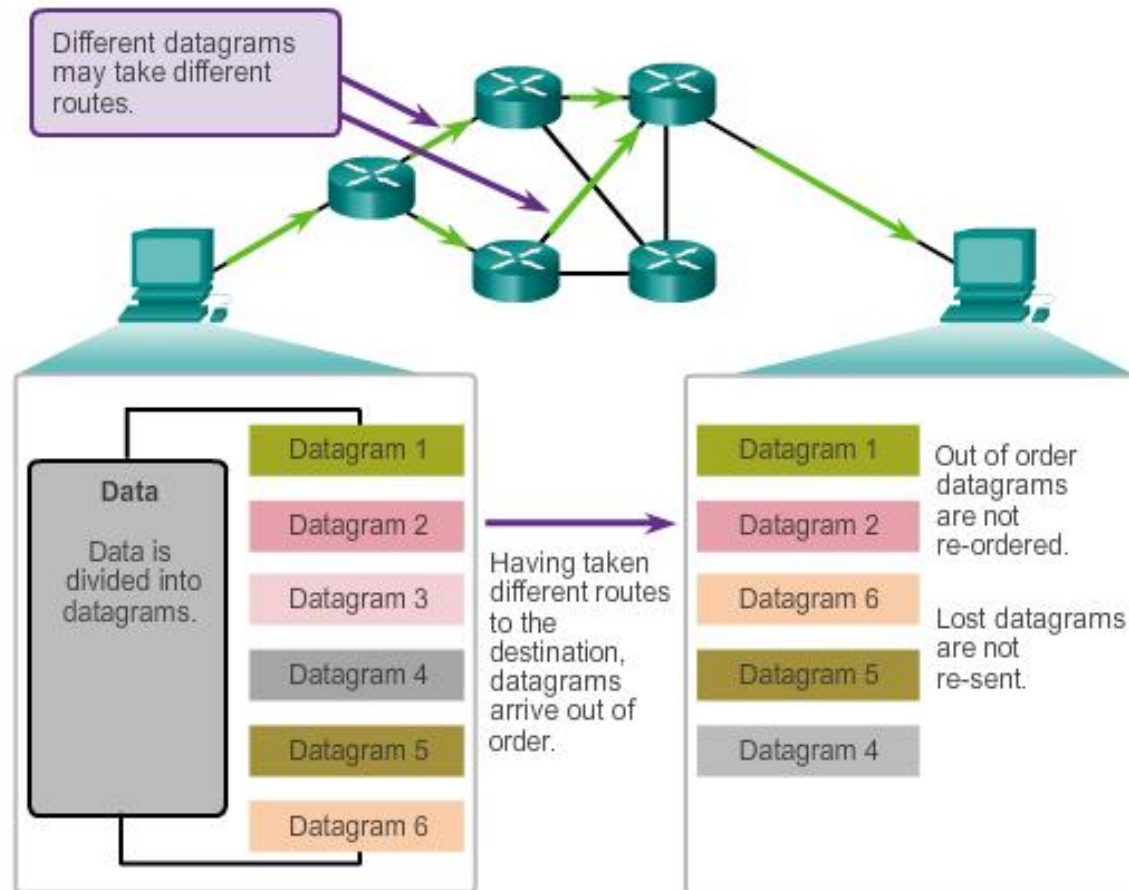

Used by

- Domain Name System (DNS)
- Simple Network Management Protocol (SNMP)
- Dynamic Host Configuration Protocol (DHCP)
- Trivial File Transfer Protocol (TFTP)
- IP telephony or Voice over IP (VoIP)
- Online games

UDP Communication Datagram Reassembly

UDP: Connectionless and Unreliable

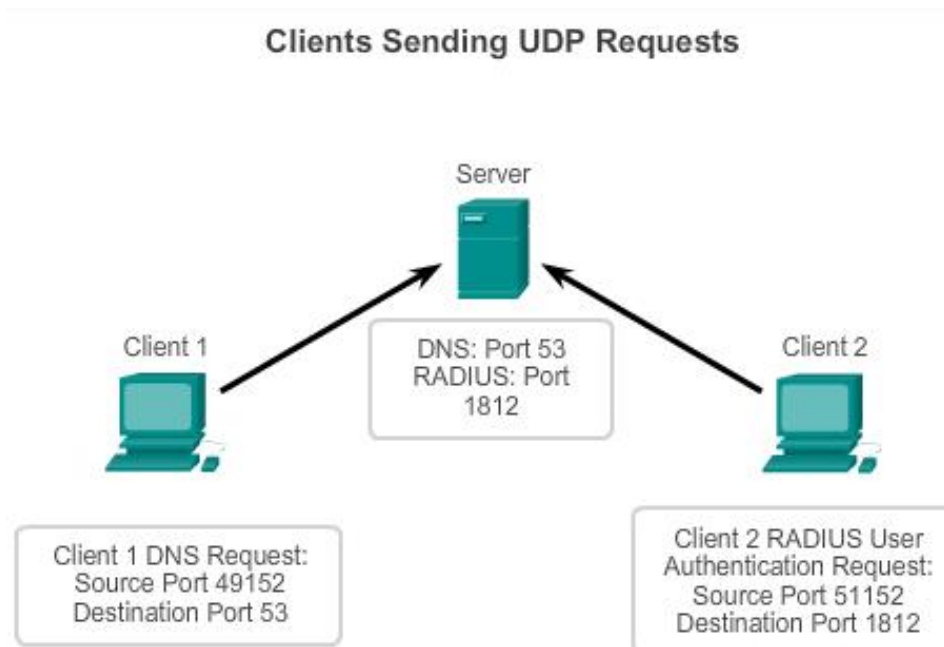

UDP Communication

UDP Server and Client Processes

- UDP-based server applications are assigned well-known or registered port numbers.
- UDP client process randomly selects port number from range of dynamic port numbers as the source port.

TCP or UDP

Applications that use TCP

TCP or UDP

Applications that use UDP

Chapter 7: Summary

- The role of the Transport layer is to provide three main functions: multiplexing, segmentation and reassembly, and error checking.
- These functions are necessary in order to address issues in quality of service and security on networks.
- Knowing how TCP and UDP operate and which popular applications use each protocol will allow the implementation of quality of service and build more reliable networks.
- Ports provide a “tunnel” for data to get from the Transport layer to the appropriate application at the destination.
